Campus Resource and Booking Management System

Centralizing campus space requests for societies, students, and organizers.

SYSTEM OVERVIEW & ACTIVITIES

A single central system designed to manage the booking and permission process for campus rooms and venues.

Society Preparation

Practice, meetings, or prep work for upcoming activities.

Workshops / Sessions

Fixed-time training, seminars, or regular sessions.

Events

Larger society or campus-wide gatherings requiring distinct venues.

LOCATION LOGIC GRID

System Selection Logic: Select Location → Choose Available Room

Problem Statement

The friction in the current manual booking process.

Motivation

Why we are building this system.

Operational Clarity (For Users)

Provides a simple, transparent way to check room availability before planning.

Eliminates confusion by allowing users to instantly see if their request is pending, approved, or rejected.

Prevents last-minute cancellations caused by overlapping bookings.

Management Efficiency (For Approvers)

Consolidates all society and organizer requests into a single, structured review space.

Standardizes the details collected so approvers have the exact right context before granting permissions.

Academic Application (For Us)

Serves as a highly practical real-world problem to apply core software engineering concepts: database design, authentication, role-based access, validation, and workflow management.

Proposed Solution

A central booking and permission workflow.

Main stage (65%)

Side-panel (35%)

Backend Functions

Automated Conflict Prevention
Real-time room availability checking.

Structured Approvals
Mandatory rejection reasons and real-time status tracking.

User History
Persistent record of past bookings.

Admin Configuration
Module to manage locations, rooms, and unavailable maintenance periods.

Note: Exact Morning/Night timings are fully configurable by admins based on campus rules, not hard-coded.

Thank You
